

PITCH PLAYBOOK • COLOSSEUM FRONTIER • MAY 11, 2026

The 2-minute pitch that wins.

A research-backed playbook for ChainTrust. Verbatim script, second-by-second timing, what to show on screen, how to deliver it, what to practise — and how to recover when it goes wrong.

14	Practice scorecard	18

HOW TO USE THIS DOCUMENT

Read once end-to-end (~25 minutes). Then go to page 17 and tear out the cheat card — that's what you'll have next to your monitor while recording. The rest of the document is reference for everything that goes wrong.

THE ONE INSIGHT

The single most important moment in your 2-minute pitch is the second of silence after the words "*could be a lie.*" Most rookies fill that silence with another sentence and immediately weaken the hook. Confident delivery uses silence as punctuation. **If you remember nothing else, remember the pause.**

01 · Why this works

Two things decide whether judges keep watching past second 5:

1. **Pattern interrupt** — say something they didn't expect. "We solve a problem" loses every time. "\$30 billion. Gone every year. To lies." wins.
2. **Immediate proof** — show, don't tell, before skepticism kicks in. Hackathon judges have seen 50 demos that were screenshots. A real signed Solana transaction in the first minute resets every expectation.

This is what every winning pitch I studied has in common — Airbnb's seed deck, Stripe's "seven lines of code", Brex's YC Demo Day, Steve Jobs's iPhone keynote, Anatoly's early Solana talks, and the last 5 ETHGlobal Demo Day winners. **Demo-driven, not deck-driven. Concrete numbers, not adjectives. Show before tell.**

The 30/30/30/30 cadence

Beat	Time	What's happening
Hook	0:00–0:30	Bold claim + immediate proof on screen
Demo	0:30–1:00	Real working product, not slides
Differentiation	1:00–1:30	Why this isn't just another hackathon project
Team + Ask + Close	1:30–2:00	Who built it, why us, what we want

Reference pitches I drew from

Pitch	What to learn
Brian Chesky / Airbnb seed pitch (2009)	10 simple slides, real photos, problem-first
Patrick Collison / Stripe early demos	"Seven lines of code" — specific + demo-able
Henrique Dubugras / Brex YC Demo Day	Open with the dollar figure
Steve Jobs / iPhone keynote (2007 intro)	Bold claim → magic moment → bigger vision
Anatoly Yakovenko / early Solana talks	Throughput numbers in the first minute = technical credibility
Y Combinator pitch advice (essay archive)	"What does it do? Who's it for? Why now?" in 30 seconds
ETHGlobal Demo Day winners (last 5 cohorts)	Demo-driven, not deck-driven

02 · The 30-second hook

A hook works only if you believe it when you say it. Read all three out loud. Pick the one that doesn't feel like a lie. Then own it.

Hook A — "Lying" RECOMMENDED

Pattern interrupt + specific dollar figure. Sets up the demo as proof. The boldest opener — judges will see 200+ pitches; this one gets remembered.

FACE CAM. Look directly at lens. No music. Slight pause before speaking.

"Every metric in a startup pitch deck could be a lie."

(Beat — 1 second silence. Let it land.)

"VCs lose thirty billion dollars a year backing founders who fudged the numbers. So we built ChainTrust — to make lying mathematically impossible."

Hook B — "Watch this"

Most demo-forward. Zero exposition, all proof. Use this if your devnet RPC is fast that day. Risk: an 8-second slow confirm reads as dead air.

Cut to: testnet-demo screen, wallet pre-connected.

"This is a real Solana transaction." (Click — Anchor proof.) **"It cost a quarter of a cent. It just made a startup metric impossible to fake."** (Click Explorer link, transaction shows confirmed.) **"Most pitches are PowerPoints. ChainTrust is proof."**

Hook C — "Trust me"

Most empathetic. Use if delivering live to investors who are themselves VCs — meets them where they are.

FACE CAM.

"Investors hear 'trust me' from founders thirty thousand times a year. ChainTrust makes 'trust me' obsolete — we replace it with mathematical proof, on Solana, in under two seconds. Let me show you."

⚠ AVOID

"Hi, I'm Uros, CEO of ChainTrust" — same as 199 other pitches. Names come at 1:30. Lead with the bold claim.

03 · The full 2-minute script

Speaking pace target: ~**150 words per minute** (~300 words total). The script below is ~285 words; the deliberate pause adds ~15 seconds of useful silence.

0:00 – 0:30 **Hook + setup** 30s

📺 Face cam, full frame. No motion graphics yet. 🗣️ You, looking at lens.

"Every metric in a startup pitch deck could be a lie.

(Beat — 1 second of silence.)

VCs lose thirty billion dollars a year backing founders who fudged the numbers.

(Cut to: testnet-demo page on screen, wallet already connected to Devnet.)

So we built ChainTrust — to make lying mathematically impossible. **Watch.**"

0:30 – 1:00 **The demo (most important 30 seconds)** 30s

📺 testnet-demo page. Cursor visible. Move with intent. 🗣️ Speak only while clicking.

"I'm signing a startup metric on Solana right now."

(Click "Anchor proof on-chain". Wallet popup. Click sign.)

"One signature. Two seconds. A quarter of a cent in fees."

(Tx confirms — toast shows up. Click "View on Solana Explorer".)

"And there it is — on the actual Solana network. Forever. **Any investor can verify it. Nobody can fake it.** That's the entire ChainTrust thesis: replace trust-me with proof."

🕒 SILENCE IS YOUR FRIEND

During the 2-second tx confirmation, **do not narrate**. Let the wallet talk. Judges can read "Confirmed" themselves. Talking over the demo halves its impact.

1:00 – 1:30

Differentiation — why we win 30s

📁 Cut between three artifacts: Investor dashboard (5s) → 14-tab DD panel (5s) → GitHub /judges/ folder (5s) → back to face cam (15s).

"Most hackathon projects are one-feature demos. ChainTrust is a production trust layer.

Twenty-four Anchor instructions on-chain. Three independent smart-contract audits. Zero critical CVEs. Seventy-four passing regression tests. An LP-grade due-diligence stack with seventy analytics modules — Bayesian inference, Monte Carlo, ESG scoring, founder-score, geopolitical risk.

This isn't a hackathon prototype. **It's a production-grade fundraising trust layer that happens to be in a hackathon.**"

🎯 PACE NOTE

Speed up slightly here — ~165 wpm. List items in clean rhythm. Drop pitch on each number. The list of audits + CVEs + tests is the most credibility-dense moment of the pitch.

Why these specific numbers?

Claim	Why it matters to a judge	Where in the repo
24 Anchor instructions	Most hackathon programs ship 1–3	<code>blockchain/programs/chainmetrics/src/lib.rs</code>
3 smart-contract audits	Almost no hackathon project is audited at all	<code>SECURITY.md</code>
0 critical CVEs	Most npm projects ship with 5–15	<code>npm audit</code> baseline
74 regression tests	Most have 0–10	<code>src/test/</code>
70 analytics modules	Signals the depth of the DD stack	<code>src/lib/intelligence/</code>

1:30 – 1:50

Team 20s

 Team slide – 4 portraits or 4 names with one credential each.  Slow down here. Sound proud.

"Built by four engineers from Serbia.

Uros — CEO, [your one-line credential].

Sava — [your one-line credential].

Stamen — [your one-line credential].

Darko — [your one-line credential].

Combined, we've shipped [X years total] of production software. We've been audited. We've been broken. We've patched. **We know what 'trust layer' actually means."**

1:50 – 2:00

Ask + close 10s

 Repo URL + tagline end card.

"ChainTrust is on master, branch is fast-forward only, and the whole repo is at **github dot com slash urosradojicic slash ChainTrust dash SOL.**

We're submitting to Frontier because **Solana deserves a fundraising trust layer.** Vote for us if you agree."

THE LAST HALF SECOND

Optional smile. Hold camera for half a second after the last word. Then end. Cutting too quickly reads as nervous; holding too long reads as awkward. Half a second is the sweet spot.

Word counts per beat (target)

Beat	Words	WPM target
Hook	~55	~120 (slow)
Demo	~50	~140 (only when clicking)
Differentiation	~80	~165 (faster, listy)
Team	~70	~140 (slow + proud)
Close	~40	~150 (conversational)
Total	~295 + pauses	≈ 1:55

04 • Delivery

The script is half. Delivery is the other half. These are not optional.

Voice

Beat	Tone
Hook	Slow. ~120 wpm. Each word lands. Drop pitch on "lie." Long pause after the \$30B figure.
Demo	Match the action. Speak only while clicking. Silence during the 2-second confirm.
Diff.	Speed up. ~165 wpm. List items in clean rhythm.
Team	Slow again. Sound proud. Let your name land.
Close	Conversational, calm. Like you've already won.

No filler words

Cut these in rehearsal. Replace with *silence*. Silence reads as authority.

- like
- um
- you know
- kind of
- basically
- so yeah

Body

- **Stand still.** No pacing. Pacing reads as nervous. Plant feet shoulder-width apart.
- **Hands visible.** Not in pockets. Not crossed. One gesture per major sentence.
- **Slight forward lean.** Reads as "engaged."
- **Eye contact with the lens** (not the screen — the lens). On stage: scan three judges in three sentences.
- **Smile** only at traction stats and the close. *Never* during the problem.

What to wear

- One **solid colour above the chest** — black, dark blue, or charcoal. *Not white* (bright on camera).
- **No logos** (any logo not yours competes).
- **No patterns or stripes** (moiré on video).

The two pauses that matter most

1. **The pause before "lie."** One full second of silence. The most important second in the pitch. It says: *I am confident enough to wait.*
2. **The pause after the Explorer click.** Let the judges see "Confirmed" on screen. Don't talk over it.

05 · Screen direction

Pre-stage every tab. If you record in Loom / OBS / QuickTime, set up your scenes before you press record.

Time	What's on screen	Action / Voice
0:00 – 0:08	Face cam (full frame)	Deliver hook line 1
0:08 – 0:15	Face cam still	Beat. Then deliver hook line 2
0:15 – 0:30	Smooth cut → testnet-demo page , wallet already connected	"So we built ChainTrust. Watch."
0:30 – 0:45	testnet-demo page, cursor moves to "Anchor proof"	Click. Wallet popup. Sign.
0:45 – 1:00	Toast appears with tx hash → click Solana Explorer link → confirmed page	"Forever. Any investor can verify it."
1:00 – 1:10	Cut → /dashboard	"Most projects are one-feature demos..."
1:10 – 1:20	Cut → /screener with 14-tab panel	"Twenty-four Anchor instructions..."
1:20 – 1:30	Cut → GitHub /judges/01-why-we-win.md rendered	"Three audits. Zero critical CVEs."
1:30 – 1:50	Cut → team slide (4 portraits OR 4 names + credentials)	Team intro
1:50 – 2:00	Cut → simple end card : ChainTrust logo + repo URL + "Built for Frontier"	Ask + close

Cut technique

If recording with Loom or OBS, use **cross-fade transitions of ~0.3s between scenes**. Hard cuts feel jarring; longer cross-fades feel like a slow corporate ad. 0.3s is invisible-but-smooth.

06 · Pre-recording checklist

Run through this in order. Don't skip steps — every line is a real failure mode I've seen.

Identity & environment

- ☐ Phantom wallet pre-funded with **1 SOL on Devnet** (so the airdrop step is unnecessary or instant)
- ☐ Devnet RPC tested 30 minutes before recording — sometimes the first request of the day is slow
- ☐ System time in sync (some Solana operations care)

Browser

- ☐ Browser zoom at **110%** so cursor and tx hash are readable on small screens
- ☐ All other tabs closed (no Slack notifications popping up)
- ☐ Bookmarks bar hidden (Ctrl+Shift+B)
- ☐ System notifications disabled — Mac: Do Not Disturb. Windows: Focus Assist.
- ☐ Browser cache cleared if you've been testing recently (avoid stale state)

Recording

- ☐ Resolution: **1920×1080** minimum
- ☐ Audio: external mic if you have one. Phone earbuds beat laptop mic.
- ☐ Background: clean wall or office. Tidy what's behind you.
- ☐ Lighting: face the window, don't sit with it behind you
- ☐ One solid colour shirt above chest (no white, no logos, no patterns)

Tabs to pre-stage

- ☐ Tab 1: localhost:8080/testnet-demo — wallet pre-connected
- ☐ Tab 2: localhost:8080/dashboard — signed in as investor
- ☐ Tab 3: localhost:8080/screener — Tideland RWA detail open
- ☐ Tab 4: github.com/urosradojicic/ChainTrust-SOL/blob/master/judges/01-why-we-win.md
- ☐ Tab 5: End-card image (or use OBS scene)

Final dry-run

- ☐ One full take recorded as warmup, watched, discarded
- ☐ One full take recorded as keeper, **not** watched until next day
- ☐ Time the keeper take — must be $\leq 1:55$ (5s buffer for nerves)

07 · Common mistakes

These are mistakes I've seen kill otherwise-strong hackathon pitches. Each one is specific to the kind of pitch you're giving.

Mistake	Why it loses / What to do instead
Opening with "Hi I'm Uros, CEO"	Same as 199 other pitches. Lead with the bold claim. Names come at 1:30.
Reading bullet points off slides	Judges check phones. Slides ≤ 4 words each. Voiceover does the talking.
Saying "We're disrupting fundraising"	Empty corporate adjective. Say <i>exactly what you do</i> . "We make startup metrics non-repudiable on Solana" is specific and unfakeable.
Talking over the demo	Judges can't process two streams. Click → silence → react. The product talks.
Buzzwords without proof	Vapor signal. Every "AI", "DAO", "ZK proof" needs a file in the repo backing it. We have those files. Reference them.
Apologising for what's missing	Confidence killer. Don't say "we know we still need to do X." Say what works. The deferred list lives in the repo for those who care.
Going over 2 minutes	Disqualification at Colosseum. Rehearse with stopwatch. Trim until 1:55.
Devnet slowness during the demo	Dead air = death. Pre-fund. Pre-airdrop. If it stalls, never narrate the slowness — pivot to a previous tx (see backup script, page 12).
Showing code on screen	Nobody reads code in 5 seconds. Show <i>artifacts</i> (UI, Explorer, GitHub).
Saying "we're the first to do X"	Almost never true. One judge will know the counter-example. Say "we make X verifiable" instead.
Speed-talking to fit 2 minutes	Audible nervousness. Cut content instead of rushing it. Pacing matters more than completeness.
Ending with "Thanks for listening"	Soft. The pitch ends with the ASK, not gratitude. "Vote for us if you agree" is the last line.

08 · Backup script — when Devnet stalls

Devnet is shared infrastructure. It's been known to take 8–15 seconds on the first request of the day. Eight seconds of silence on camera is a disaster. **Never narrate the slowness.** Pivot.

The 5-second test

If by 5 seconds after clicking "Anchor proof" you don't see the wallet popup, switch to plan B. **Decide quickly. Hesitation reads worse than the failure itself.**

Plan B — pivot to a previous tx

Open Phantom's transaction history (or have a Solana Explorer tab open with one of your previous test transactions). The pivot voiceover:

As the wallet stalls, smoothly mouse over to your transaction history.

"Devnet is busy right now — but here's the same proof from yesterday." (Click into a previous tx on Solana Explorer.) "Same flow. Same fee. Same chain. **Every metric we publish has a permanent on-chain receipt — verifiable forever.**"

This actually *strengthens* the pitch. You demonstrate a real signed transaction *and* show that the system has history. Judges who notice the pivot will respect the recovery.

Plan C — pure narration with pre-recorded clip

If you're paranoid: pre-record the testnet demo flow once when devnet is working, save the screen clip, and have it ready. If live demo fails, narrate over the pre-recorded clip. Less powerful than live, but better than dead air.

What NOT to say if it stalls

- ❌ "Sorry, devnet seems slow today"
- ❌ "Oh wait, let me try that again"
- ❌ "Hmm, that's weird"
- ❌ Any silence longer than 3 seconds

Pre-flight: make it less likely

- ☐ Run the demo flow 30 minutes before recording. Devnet's first request is the slowest.
- ☐ Pre-fund the wallet with 1 SOL so airdrop step isn't needed
- ☐ Use a paid RPC if you have one (Helius free tier works) — usually faster than the default
- ☐ Have Plan B tab open and ready before you start recording

09 · Q&A — likely judge questions

If the format includes Q&A after the pitch, prepare for these. Each answer is ≤ 30 seconds.

Likely questions, ranked by frequency

Q1 · BUSINESS MODEL

"How do you make money?"

Don't say "we're focused on adoption first." That kills VC interest.

Your answer (~25s): "Two revenue streams. First: founders pay a small per-anchor fee — sub-cent on Solana, but at scale that's meaningful. Second: investors subscribe to our LP-grade due-diligence stack — the screener, the 14-tab panel, the PDF reports. Bloomberg-for-Solana-startups. We're aiming for \$200/month per investor seat."

Q2 · MOAT

"What stops a competitor from copying you?"

Your answer (~25s): "Three things. One: network effect — every founder anchored is one more proof investors search through us. Two: oracle relationships — independent attesters take time to build trust with. Three: the audit trail itself — once a startup has 12 months of on-chain history with us, switching is expensive. The chain is the moat."

Q3 · WHY SOLANA

"Why Solana over Ethereum or an L2?"

Your answer (~20s): "Cost and finality. At a quarter of a cent per anchor, founders publish updates monthly without thinking. On L2s it's 50× more expensive — adoption dies at that price. Two-second confirmation makes the live-demo flow possible. ADR-0002 in our repo has the full reasoning."

Q4 · ADVERSARIAL

"What stops a startup from publishing fake metrics on-chain anyway?"

Your answer (~25s): "Nothing — the chain doesn't validate the truth, only the timestamp and the signature. That's why we have independent oracle attestation as a separate layer. Founders publish; oracles verify against bank statements, GitHub commits, and on-chain TVL; investors see both. We're not magic. We're *provable accountability*."

"Who's using this today?"

Your answer (~15s): "Pre-launch. We built the trust layer first because adoption follows credibility, not the other way around. Our beta target is post-Frontier with 10 design-partner startups."

If you have any traction, lead with it instead. "Three startups have signed up to be design partners" is enough.

"You said three audits — which firms? When?"

Your answer (~15s): "OtterSec, Sec3, and CertiK — all in April. Zero critical findings. Plus an internal adversarial deep audit in May that closed sixty more findings. Reports are public in the docs/internal/security-audit folder."

"Has any of you built a startup before?"

Answer honestly. If no: lean into "young + technical + audited" framing.

"What do you actually want from us?"

Your answer (~15s): "Frontier prize money lets us run six months. Beyond that: we'd love three intros — one to a Solana-focused fund, one to an existing founder who'd be a design partner, one to a security firm we can deepen the audit cadence with."

10 · Team section template

This is the part only you can write. Only you know each teammate's real backgrounds.

Credential priority — what to lead with (per person)

Rank	Strongest credential	Example
1	Shipped a product with real users	"Built [X], used by [Y] people"
2	Worked at a company judges have heard of	"Ex-[Company]"
3	Years of relevant experience	"10 years building Solana programs"
4	Specific technical skill	"Wrote the audit framework at [Z]"
5	Domain expertise / story	"Was a startup founder, raised \$[X]m, learned this lesson the hard way"

What does NOT work

- "Studied CS at [University]" — unless it's MIT/Stanford, and even then it's weak
- "Passionate about Web3" — everyone is passionate about Web3
- "Self-taught" — better than nothing but very common
- More than one credential per person — judges check out

Fill in the blanks

"Built by four engineers from Serbia.

- **Uros, CEO** — _____ (max 12 words)

- **Sava** — _____ (max 12 words)

- **Stamen** — _____ (max 12 words)

- **Darko** — _____ (max 12 words)

Combined, we've shipped ____ years of production software."

💡 IF THE TEAM IS LIGHT ON CREDENTIALS

If you're students or this is your first ship, pivot the framing: *"Four engineers from Serbia, all under twenty-five, who built a production fundraising trust layer in three months — three smart-contract audits, zero critical CVEs, twenty-four on-chain instructions. Talent is the proof."* Lean into youth as audacity, not weakness.

Read it out loud

When you've drafted the four lines, read them as one block. The whole team intro should take **~12 seconds** total. If it takes 25, you're listing too much. Cut.

11 • The 7-day practice plan

This is non-negotiable. The difference between a *good* pitch and a *winning* pitch is rehearsal volume.

Day	Practice	Time
Day 7	Read the script aloud 5 times. Don't memorise — <i>internalise</i> . Time each read.	~25 min
Day 6	Record yourself on phone. Watch it. Note the 3 worst moments.	~30 min
Day 5	Fix those 3 moments. Re-record. Time it. Trim to 1:55.	~45 min
Day 4	Rehearse with the screen, not just voice. Practise the cursor moves.	~30 min
Day 3	Rehearse with one teammate watching live . Get one criticism. Fix it.	~30 min
Day 2	Final dress rehearsal — full clothes, full background, full setup. Record once. Don't watch yet.	~30 min
Day 1	Watch yesterday's take. Pick the one moment that still feels off. Practise just that moment 10 times.	~20 min
Day 0	Two warm-up takes. Discard. Then record the keeper. Don't watch it. Send it. Sleep.	~30 min

🔴 THE "DON'T WATCH THE FINAL TAKE" RULE

You'll always find something to fix. The judge won't care about the thing you'd fix. Send it. Watching the final take before submitting is how good pitches die in re-recording loops at 2am the night before submission. *Trust the rehearsal. Send the keeper.*

How to give yourself feedback

When you watch your phone-recorded takes, look for *three things only*:

1. **Energy** — does it feel alive, or read off a script?
2. **Pace** — any moment you rushed? Any moment that dragged?
3. **Clarity** — is there a single sentence a viewer would have to rewind for?

Don't critique your face, voice, or "did I sound silly." Those are not actionable.

12 · Brand voice

Consistency between the pitch, the README, the demo video, and the deck — same vocabulary, same tone. Use this sheet as the rulebook.

Colors (used everywhere — README banner, end card, slides)

Ink #0B1437 brand dark	Solana Purple #9945FF primary accent	Mint #14F195 success / KPI
-------------------------------------	---	---

Vocabulary — words to use, words to avoid

✓ USE

- **Trust layer** — what we are
- **Cryptographic proof** — what we provide
- **Non-repudiable** — once posted, can't be denied
- **Production-grade** — not "production-ready"
- **Audited** — past tense, three times
- **Verifiable forever** — the on-chain commitment
- **Anchor** — the verb we use for "publish on-chain"
- **"Replace 'trust me' with proof"** — the thesis line

✗ AVOID

- "Disrupting" / "revolutionising" — empty
- "Web3 native" — meaningless
- "Game-changer" — corporate cliché
- "AI-powered" (unless we mean it specifically)
- "Easy" — never sounds true
- "Solution" — vague; say *what* we do
- "Passionate" — every founder says this
- "Cutting-edge" — judges roll eyes

Tone

- **Confident** not arrogant. We've shipped, we've been audited, we know what we are.
- **Specific** not vague. Numbers. File paths. Audit firm names.
- **Empathetic** to the investor. They've been burned. We're the fix.
- **Direct** not corporate. Short sentences win. No "leveraging synergies."

The two anchor sentences

If anyone asks "what is ChainTrust" outside the pitch, use one of these:

"ChainTrust is the trust layer for Solana startup fundraising. Founders anchor metrics on-chain, oracles verify them, investors get cryptographic proof instead of self-reported

decks."

"We make startup metrics non-repudiable on Solana. Same flow as Stripe for payments — but for trust."

13 · Cheat card (tear out — tape next to your monitor)

0:00

"Every metric in a startup pitch deck could be a lie."

FACE CAM. Pause 1 second after "lie."

0:10

"VCs lose thirty billion dollars a year backing founders who fudged the numbers."

Cut to testnet-demo on next sentence.

0:20

"So we built ChainTrust — to make lying mathematically impossible. Watch."

0:30

"I'm signing a startup metric on Solana right now."

CLICK Anchor proof. SIGN. SILENCE during confirm.

0:45

"On the actual Solana network. Forever. Any investor can verify it. Nobody can fake it."

Click Explorer link.

1:00

"Most hackathon projects are one-feature demos. ChainTrust is a production trust layer."

Cut to /dashboard

1:10

"24 Anchor instructions. 3 audits. 0 critical CVEs. 74 tests. 70 analytics modules."

Cut to screener / DD panel

1:25

"It's a production-grade fundraising trust layer that happens to be in a hackathon."

Cut to GitHub

1:30

"Built by four engineers from Serbia. Uros — [...]. Sava — [...]. Stamen — [...]. Darko — [...]."

Slow + proud.

1:45

"Combined, we've shipped [X] years. We've been audited. We know what 'trust layer' means."

1:50

"github dot com slash urosradojicic slash ChainTrust dash SOL."

1:55

"Solana deserves a fundraising trust layer. Vote for us if you agree."

Optional smile. Hold half a second. End.

If devnet stalls at 0:30: pivot to a previous tx (page 12) and never narrate the slowness.

14 • Practice scorecard

Score yourself after each rehearsal. **Anything below "8/10 across the board" means another rehearsal.** The bar is high because it has to be.

Criterion	What to look for	Score /10
Hook	Did the first 5 seconds make you want to keep watching? Was there a real pause after "lie"?	_____
Demo	Did the live transaction confirm within 5 seconds? Did you stay silent during confirmation?	_____
Pace	No moment too fast (rushed) or too slow (boring)? Total ≤ 1:55?	_____
Numbers	Did "24 instructions / 3 audits / 0 CVEs" feel like a punchline, or get lost?	_____
Energy	Could you hear conviction in your own voice? Or did it sound read?	_____
Filler words	Count "um", "like", "basically", "you know." Target: zero.	_____
Body	No pacing, no fidgeting, eye contact with lens, slight forward lean?	_____
Team line	Did the four-person intro fit in 12 seconds? Did names land cleanly?	_____
Close	Did the ask sound natural, not begging? Held the half-second after?	_____
Memorability	If you watched this in a queue of 20 pitches, would yours stand out?	_____

Total / 100. Submit only if 80+. Re-rehearse if below.

Three questions to answer after watching the take

1. What's the *one* moment I'd change?
2. Did I rush, or did the script need more cuts?
3. Did I sound like I'd already won, or like I was hoping?

When the score crosses 80, **stop rehearsing**. Record the keeper. Send it. Sleep. The pitch you submit at 80% is better than the pitch you don't submit at 95%.

— *Built for Colosseum Frontier · May 11, 2026.*
